Tools used to improve security, reliability and performance in your system. Wise Defender is a Windows error-checking utility designed to help you to keep your system running in a fast and stable condition. What makes the application stand out from the crowd is its system-wide detection and display of critical Windows issues, such as running processes that are about to expire or have already expired. So, you see your system is not working perfectly, or in the least, you notice that something isn't right. The great news is that it doesn't take a lot of effort to figure out what went wrong. Just download the application and launch the wizard that will guide you through all steps required to gather and analyze all system logs that have been created since the last time the system was working correctly. All these logs are then displayed in a single window, making it very easy for you to spot any irregularities or errors that might have occurred in the system. A simple and easy to use application In order to start the process, all you have to do is to select a location in which to store all the data gathered from system logs. In addition, you can decide whether or not you want the application to refresh the logs every time you restart your system, so that you'll always have a current copy of everything that is being displayed. After all of the details have been stored, the system will then start checking and updating the files, with one progress indicator displaying the name and version of the selected file. Moreover, the application will notify you whenever it encounters an error, which can be displayed in two different ways: as a text message, or as an icon. In case you need to quickly check the validity of the log information, the application can display the log data in a text file, where you'll see the complete log information, including the timestamp of the event and the memory address where it was detected.
